

WHAT IS HARTEN

Understand the application before you commit to changing it.

Harten helps organisations understand complex applications well enough to make defensible decisions about transformation, modernisation and application innovation.

01

Understand

Establish what the application does, what it depends on and where important uncertainty remains.

02

Specify

Prepare a reviewable current-system baseline that distinguishes established behaviour from what still needs investigation.

03

Plan

Turn that understanding into a defensible basis for modernisation, transformation and future application change.

Wayfinder (MaaS)

Wayfinder is Harten's software intelligence platform for turning application evidence into reviewable understanding, specifications and proposed modernisation plans. It helps carry application knowledge forward so discovery, architecture and delivery do not become disconnected exercises.

Evidence before commitment.

Digital transformation and application innovation depend on understanding the systems being changed. Harten establishes that understanding before important commitments harden.

What you get

A clear, defensible basis for decision-making that your architects, programme teams and delivery partners can use.

01

Application baseline

What the system appears to do, how it is structured and what it depends on.

02

Current-system specification

A reviewable account of behaviour, constraints and the capabilities that need to be preserved, changed or retired.

03

Uncertainty and risk picture

What remains unresolved, what evidence is missing and why those gaps matter to the decision.

04

Proposed modernisation plan

How the work could proceed, including dependencies, sequencing, constraints and verification requirements.

Where Harten fits

Harten supports complex application change across the transformation lifecycle.

01

Before procurement

Establish a clearer basis for scope and supplier conversations.

02

Before rewrite or migration

Understand what must be preserved before selecting the target approach.

03

During supplier handover

Reduce dependency on undocumented knowledge and partial assumptions.

04

During programme recovery

Re-establish the application baseline when delivery has lost certainty.

05

Before business case or investment approval

Improve the evidence behind cost, risk and modernisation decisions.

Understand more before you commit more.

Speak with Harten →

One application. One decision. Defined evidence.

Harten starts with a bounded application or capability and establishes the reviewable basis for the decision the organisation needs to make.

01

Agree the decision and evidence

Define the question to support, the application boundary and the evidence available.

02

Establish the application baseline and specification

Reconstruct current behaviour, dependencies, constraints and material uncertainty.

03

Prepare the plan and next-step recommendations

Produce the decision basis, risk picture and proposed path for modernisation or application change.

Who we help

We work with organisations involved in complex application transformation and innovation.

01

Government and regulated organisations

Where governance, assurance, legacy risk and accountable decision-making matter.

02

Consultancies and system integrators

Where stronger application understanding improves bids, mobilisation, delivery planning and programme recovery.

03

Technology and programme leaders

Where transformation, modernisation or new application investment needs a clearer technical and commercial basis.

Generated output is prepared for review. Acceptance depends on evidence, domain expertise and accountable human judgement.
